Why farmers **lose money**

Kazakhstan is one of the largest pastoral countries in the world. 70% of agricultural land is pasture. Yet farmers still use 100-year-old methods.

400,000 heads lost annually 01

5% of livestock is lost every year — theft, predators, straying. Billions of tenge in damages nationwide.

Fencing: \$1,500–2,500/hectare 02

Physical fencing is extremely expensive. For rotational grazing, stationary fences are useless.

Shepherd: \$300–600/month 03

Human factor, fatigue, illness. A shepherd cannot watch 24/7 and lacks full situational awareness.

No pasture data 04

40% of land is used irrationally. No tools to show where herds grazed and what has recovered.

One tag — full control

SteppeAI leverages herd behavior: all animals follow the leader. A single IoT tag on the leader is enough.

1

Tag on the leader

IoT device is attached to the herd leader (bull, ram, stallion). Battery life 6+ months.

2

Virtual fence

Farmer draws the pasture zone on a map. The system creates a "smart invisible fence" — AI-Fence.

3

AI monitoring 24/7

Coordinates every 30 seconds. AI analyzes movement, speed, stops, anomalies and escape risk.

4

Instant alerts

When crossing boundaries → push notification via Telegram/SMS. Farmer reacts in minutes, not hours.

up to \$2,000/year

Savings for a farmer with 100 heads by reducing shepherd costs and preventing losses

Transparent pricing

One tag + subscription. ROI — less than 1 month.

Component	Description	Price
IoT Tag	GPS/LoRaWAN device for the herd leader. Battery 6+ months.	\$50
Subscription	Platform, AI analytics, alerts, maps	\$10/mo
Base Station	Coverage up to 2,000 ha. For large farms.	On request
Installation	On-site visit, setup, training	Free
